Cryptocurrencies are at a crucial moment, on the cusp of becoming the renegade's dream: a parallel, Laissez-Faire, sort of anti-economy, underpinning existing traditional economic sectors and functions. The potential to separate transactions from the centralized regulated and regulatory structures that currently create economic deadweight in the form of taxes and other legal complications and fees, is enough to make economic purists salivate – could this be the true global Laissez-Faire economic tool we have aspired to for years?

In government-run economies, the regulatory structures meant to stabilize economic activities, inevitably become tools for the preservation of a bureaucratic government structure, owned by the upper class, as it carries out ever-increasingly economically wasteful activities that serve to make the rich richer, with the proletariat bearing the burden of it all and becoming poorer all the while. One reason Bitcoin and Ethereum successfully came into existence, was that they created a new space in which a small number of people could own a new means of production (servers to mine the coin), while also providing a way to transact in a more economically, efficient manner. These currencies were written using Blockchain ledger technology, which is composed using Object Oriented protocols – a programming methodology that universities no longer include in their materials due to obsolescence.

We propose that there is a better Blockchain out there, written in a newer language with no dependence on database technology at all. We see the potential to create a hedge against failure of locally-governed, centralized currency systems on a global scale – an economic, stable underpinning that currencies backed by assets (gold or silver) and that float as governments manipulate supply and demand (the US Dollar), could never offer. Universal, global acceptance; elimination of banks as “middle men”; freedom from the regulatory burden inherent in FIAT currencies are amongst the reasons cryptocurrencies are expected to create prosperity and wealth amongst their market participants.

CryptoFund USA, LLC is formed with the goal of offering an effective Venture Capital platform, upon which to hedge against the failures of today's government-controlled or commoditized currencies, while acknowledging that governments typically maintain the infrastructure required for

these alternative currencies to exist. We see the Cryptocurrency market as an augmented purchasing mechanism, rather than an entity that competes with FIAT currency. Influential trends include the spiral development of cryptocurrency technologies, their increased integration into wealth-building banking and investment portfolio platforms, and the increasing number of merchants accepting cryptocurrency as the FIAT-currency-alternative-of-record, driving up the global cryptocurrency transaction volume and market capitalization of several cryptocurrencies, in particular.

Cryptocurrencies are tomorrow's transaction medium of speed, ease, security and convenience created using the protocols of yesterday's Object Oriented programming strategies, used in today's alternative payment method markets, trending towards mainstream use in countries with a protected, stable infrastructure, with an ever-increasing market capitalization as funding floods in. Our team here at Cryptofund USA, LLC feels that the time to develop, launch, transact-in and profit from cryptocurrency is today, and the time to develop a better way ahead is now.
